Top 50 product share
Of observed reimbursement

The business question

Where does reported prescription spending concentrate, and which comparable products merit further price review? The analysis first validates source coverage, then provides reproducible spending and investigation-priority outputs.

Where observed prescription spending concentrates

Top 10 product NDCs • 2024 archived extract • 11 states + Washington, DC

Product-level NDCs combine package sizes, not all strengths of a brand. Suppressed reimbursement is unavailable.

Biktarvy product NDC 619582501 contributes $907.89M. The top 10 product keys account for 16.4% of observed reimbursement. Product keys combine package sizes but do not combine all strengths of a brand.

Decision implication

Start reviews with high-dollar products. California supplies 56.5% of this extract's dollars; coverage, enrollment and drug mix must inform jurisdiction comparisons.

Audit and decision boundaries

The original submission is preserved; scope and assumptions are corrected in this separate portfolio version.

Verified source and join controls

Control	Evidence
Source coverage	1,048,575 records; only 11 states and DC. The worksheets reach Excel's maximum populated row.
Suppression	543,945 records have suppressed amounts. Missing dollars remain unknown, not zero-filled.
Original preservation	Original and cleaned row fingerprints reconcile. Original papers and notebooks retain their byte-level hashes.
Metadata join	Many-to-one left join preserves row count and spending; 424 conflicting directory keys are excluded from enrichment.
Metadata coverage	99.42% of reported dollars have unambiguous product metadata. Unmatched dollars stay in overall totals.

Original result reconciliation

The original Q3 median and weighted scenarios reproduce to the cent. The saved class-adjusted output is $987.70M, compared with approximately $1.2B in the paper. Ingredient-only comparisons and unsupported adoption assumptions mean those scenarios do not establish actual savings.

A narrower secondary screen

The refinement matches recorded ingredient, strength, unit, form and route within jurisdiction, quarter and utilization type. Across 562 formulations and 6,675 paired strata, it identifies a $516.16M illustrative positive gross reimbursement gap between NDA- and ANDA-listed products.

This is a price-review screen, not verified substitution potential or net savings. Therapeutic equivalence, reimbursement unit types, rebate effects, practical availability and patient suitability are unverified. Application category is not a definitive brand/generic flag.
